2.3	What values are most common from adding together the results of two twelve-sided dice?	8

Chapter 1

Introduction

Based on Alex Lalejini's wonderful example: <https://github.com/amlalejini/auto-deploying-bookdown-example>.

Chapter 2

Rolling Dice

2.1 Dependencies

```
library(ggplot2)
library(tidyverse)
library(cowplot)
source("https://gist.githubusercontent.com/benmarwick/2a1bb0133ff568cbe28d/raw/fb53bd97121f7f9ce9")
```

2.2 Setup

```
num_trials = 1000
data <- data.frame(id = 1:num_trials)
data$die.1 = 12
data$die.2 = 12
data$value_1 = sample(1:12, num_trials, replace = T)
data$value_2 = sample(1:12, num_trials, replace = T)
data$value = data$value_1 + data$value_2
data$die_combo <- paste0(data$die.1, "+", data$die.2)
data$die_combo <- as.factor(data$die_combo)
data$die.1 <- as.factor(data$die.1)
data$die.2 <- as.factor(data$die.2)
data$result <- as.factor(data$value)

theme_set(theme_cowplot())
```

2.3 What values are most common from adding together the results of two twelve-sided dice?

We rolled two twelve-sided dice 1000 times.

```
ggplot(data=filter(data, die_combo=="12+12"), aes(x=result, color=die_combo, fill=die_
  geom_histogram(stat="count") +
  facet_wrap(~die_combo, ncol=1) +
  theme(legend.position="none")
```
